

set up the two CodeIgniter projects, where one exposes data via a REST API and the other consumes the data via a REST API

set up the two CodeIgniter projects, where one exposes data via a REST API and the other consumes the data via a REST API		
Step:	Headings	Details
TS00.47	Download Code igniter	https://codeigniter.com/userguide3/installation/downloads.html
TS 00.48	Copy paste in htdocs folder in Xampp	Welcome.php">C:\xampp\htdocs\6_api\funda_api_s1\application\controllers>Welcome.php C:\xampp\htdocs\1_api http://localhost/1_api/funda/
	1. First Project (API Provider)	
	Download the Required file	<ol style="list-style-type: none">1. RestController.php2. Rest_controller_lang.php3. Rest.php4. Format.php https://www.fundaofwebit.com/post/codeigniter-3-restful-api-tutorial-using
	Paste the language file in language folder	C:\xampp\htdocs\6_api\funda_api_s1\application\language\english\rest_controller_lang.php
	Code are here	
	Copy the(rest.php) and pestle the following path	C:\xampp\htdocs\6_api\funda_api_s1\application\config\rest.php
	Code are here	
	Copy the restContrer.php & Format.php int he following path	C:\xampp\htdocs\6_api\funda_api_s1\application\libraries\RestController.php C:\xampp\htdocs\6_api\funda_api_s1\application\libraries\Format.php
	`Composer check	Open >new terminal> Write “Composer”
	Call page through composer	php -S localhost:8000
	Call the page	http://localhost:8000

set up the two CodeIgniter projects, where one exposes data via a REST API and the other consumes it

<p>Controller create : C:\xampp\htdocs\1_api\API_Provider\application\controllers\ApiDemo.php</p>	<h3>1. First Project (API Provider)</h3> <p>In your first project, you have the controller <code>ApiDemoController</code>. Let's create it:</p> <p>ApiDemoController:</p> <pre>php Copy code <?php defined('BASEPATH') OR exit('No direct script access allowed'); require APPPATH . 'libraries/RestController.php'; require APPPATH . 'libraries/Format.php'; use chriskacerguis\RestServer\RestController; class ApiDemo extends RestController { public function __construct() { parent::__construct(); // Load models if necessary } public function users_get() { // Sample data that will be returned as JSON \$users = [['id' => 1, 'name' => 'John Doe', 'email' => 'john.doe@example.com'], ['id' => 2, 'name' => 'Jane Smith', 'email' => 'jane.smith@example.com'],]; // Respond with data and HTTP status code \$this->response(\$users, RestController::HTTP_OK); } }</pre>
---	--

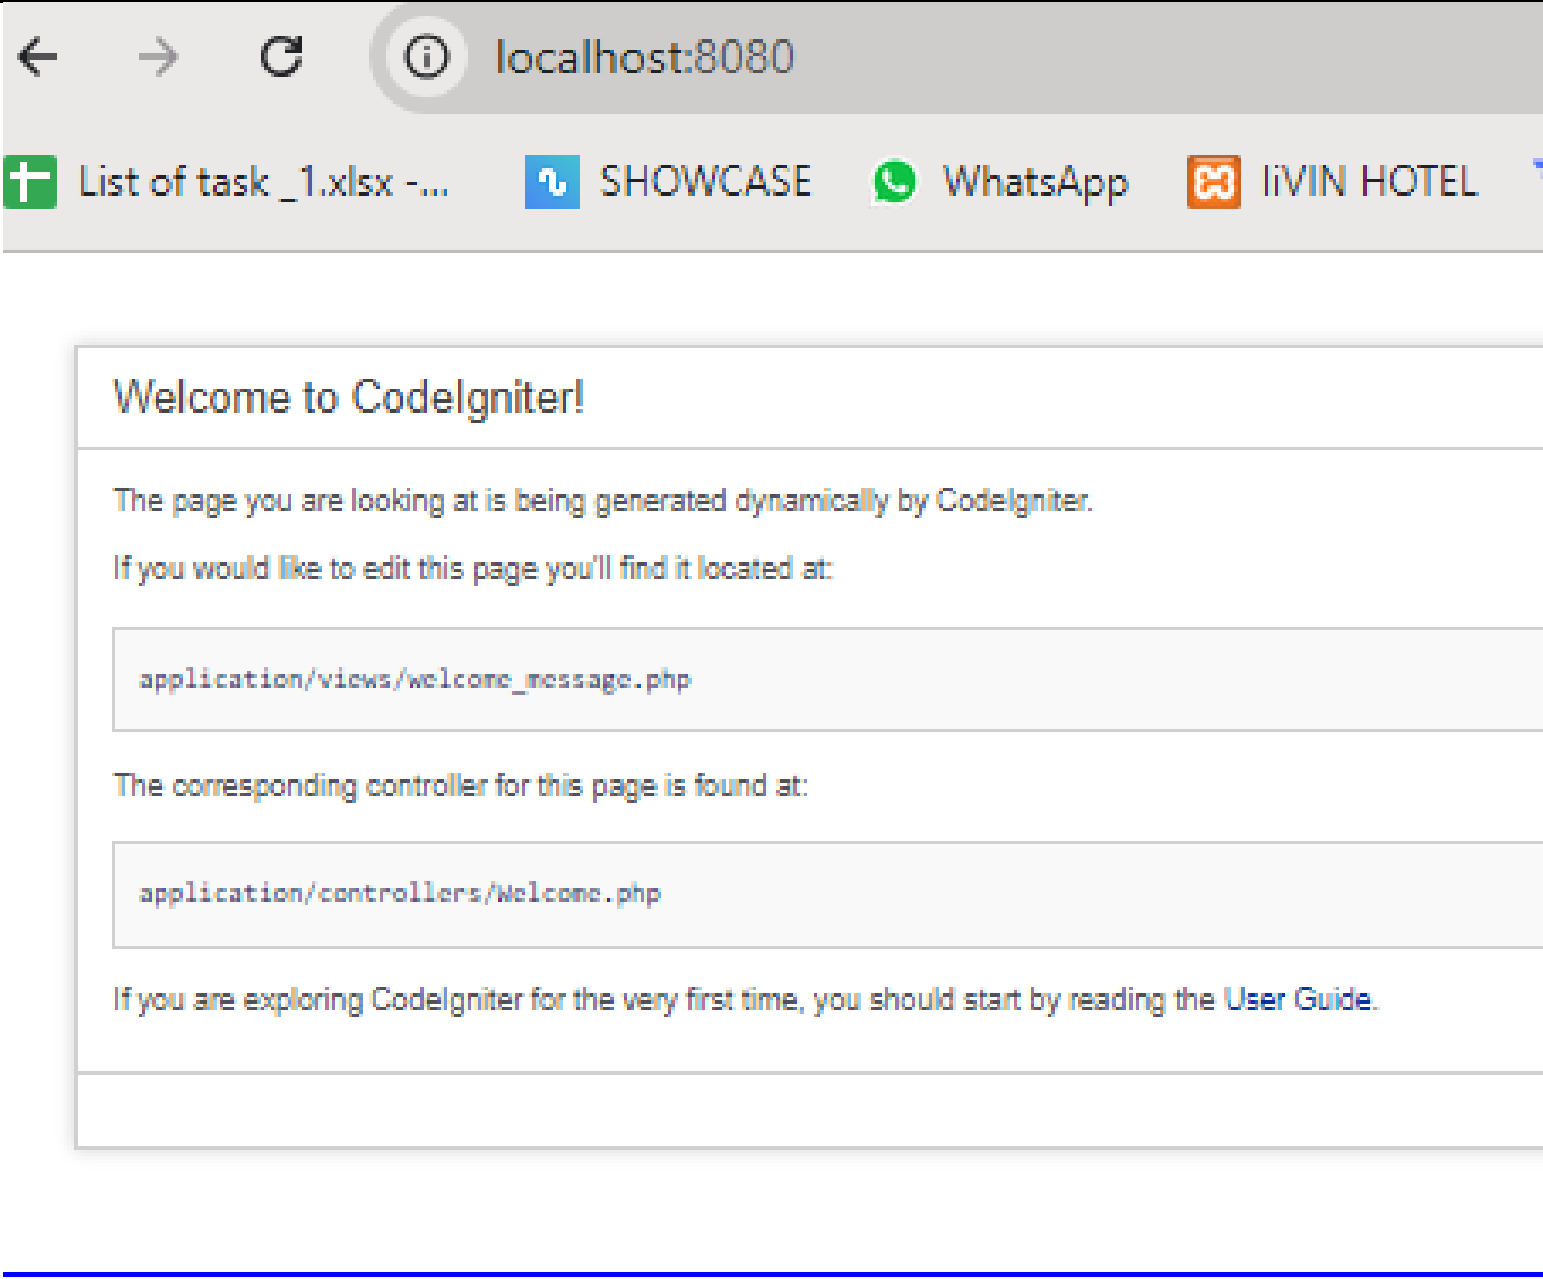

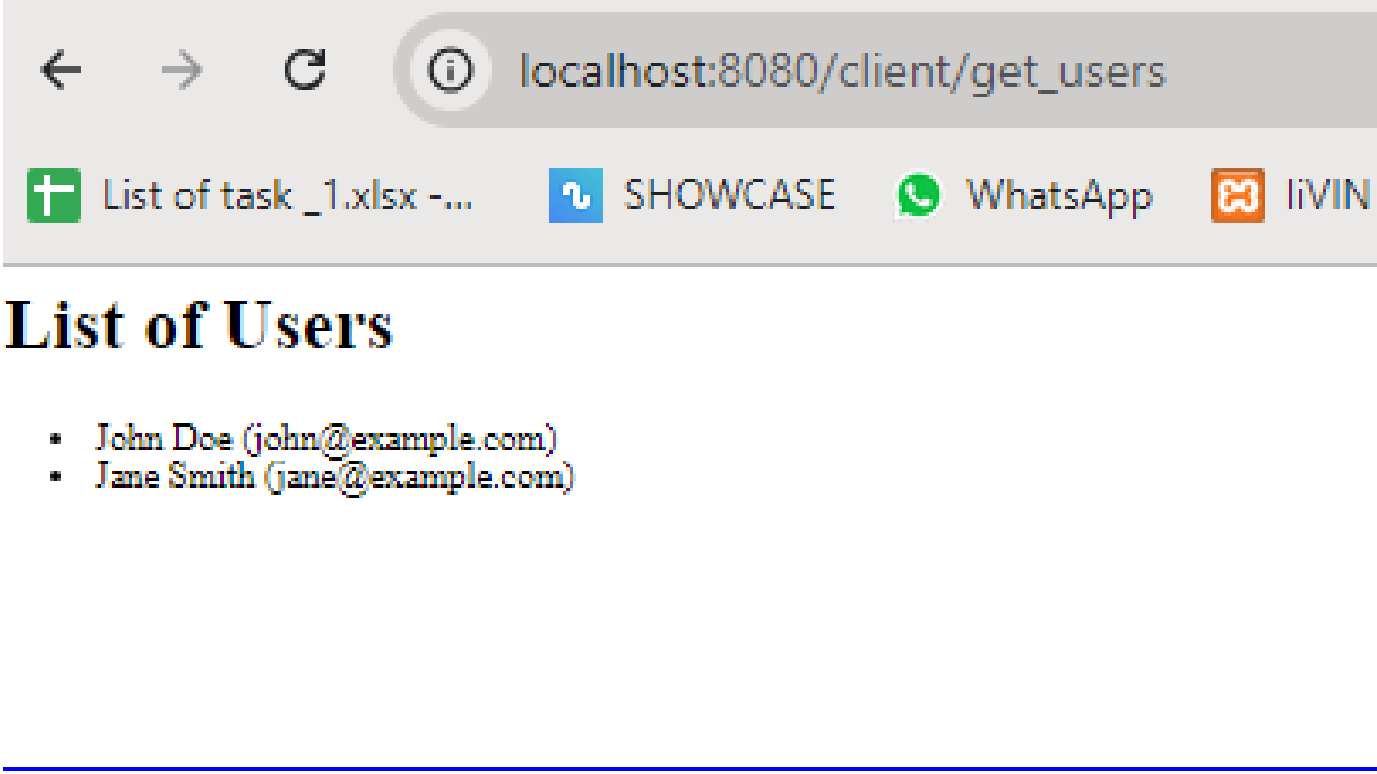

set up the two CodeIgniter projects, where one exposes data via a REST API and

		
	2. Second Project (API Consumer) In the second project, you need to make an HTTP request to the first project's API and handle the response.	
	ApiClientController:	C:\xampp\htdocs\1_api\API_Consumer\application\controllers\ApiClientController.php
		<pre><?php defined('BASEPATH') OR exit('No direct script access allowed'); class ApiClientController extends CI_Controller {</pre>

set up the two CodeIgniter projects, where one exposes data via a REST API and the other consumes the data via a REST API

		<pre>if (\$response === false) { echo "cURL Error: " . curl_error(\$ch); } else { // Decode the response \$data['users'] = json_decode(\$response, true); // Load view and pass the data (You can replace \$this->load->view('users_view', \$data); } // Close the cURL session curl_close(\$ch); } ?></pre>
	View to Display Data (users_view.php)	C:\xampp\htdocs\1_api\API_Consumer\application\views\users_view.php
		<pre><html> <head> <title>Users List</title> </head> <body> <h1>List of Users</h1> <?php if (!empty(\$users)) : ?> <?php foreach (\$users as \$user) : ?> <?php echo \$user['name']; ?> (<?php ech <?php endforeach; ?> <?php else : ?> No users found. <?php endif; ?> </pre>

set up the two CodeIgniter projects, where one exposes data via a REST API and the other consumes the data

		
	Call the page	http://localhost:8080/client/get_users
